Sine Wave Filters—Type SWF

Combined dv/dt Filtering and PWM to Sine Wave Conversion

Sine Wave Filters Exceed Ordinary dv/dt Filters

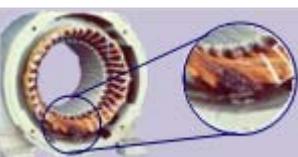

Advanced dv/dt Filtering Plus PWM Voltage to Sine Wave Conversion

SINE WAVE FILTER THEORY

Type SWF Sine Wave Filters utilize passive low pass filter technology to convert inverter Pulse Width Modulated (PWM) voltage to a sine wave. They incorporate a unique PWM rated reactor combined with a rugged harmonic rated capacitor to form a filter network that attenuates the PWM inverter switching frequency. This filter network removes most of the high frequency content (pulses) from the waveform, resulting in a nearly sine wave output voltage. Motors are protected against dv/dt and excessive peak voltage, and the motor will see normal peak voltage (approximately equal to the DC bus voltage).

MOTOR DAMAGE

PWM voltage consists of numerous fast rising (high dv/dt) pulses. When motors are located a long distance (beyond critical cable length as shown in chart) from an inverter, a phenomenon known as voltage reflection occurs, causing the *peak voltage* at the motor terminals to be as high as 2X the inverter DC bus voltage (nearly 3X system voltage). Most of this *excessive peak voltage* is impressed upon the first turns of the motor windings and can cause premature failure. Arteche Type SWF Sine Wave Filters are superior to typical dv/dt filters. Our Type SWF filters eliminate the threat of excessive peak voltage and protect motor windings for any and all cable lengths.

Damaged by Excessive Peak Voltage

Arteche Sine Wave Filters are superior to typical dv/dt filters. Our Type SWF filters will eliminate the threat of excessive peak voltage and protect motor windings for any and all cable lengths.

SWF FILTER MEETS NEMA STANDARD MG-1, Part 30

Since the Type SWF Filter output voltage is nearly a sine wave, virtually *infinite** motor cable lengths are possible (except for voltage drop). The waveform achieved through the proper application of our sine wave filter complies with the requirements of NEMA MG-1, Part 30, for non-inverter duty motors.

Type SWF Motor Protection

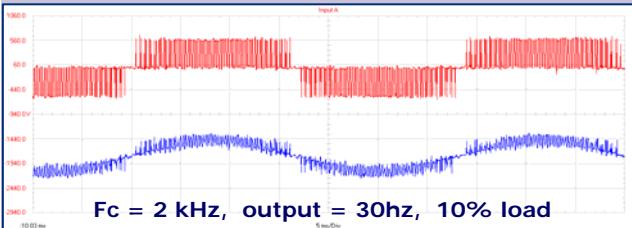

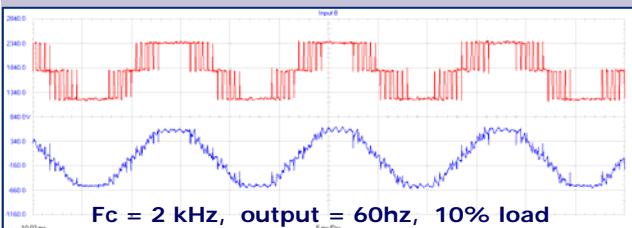

Arteche Type SWF Filters make it possible to use either a non-inverter duty motor or inverter duty motor in a VFD application. Both inverter duty and non-inverter duty motors can experience extended life and reduced power losses when protected by Sine Wave Filters.

Critical Motor Cable Length

| PWM Pulse Rise Time | Critical Cable Length |
|---------------------|-----------------------|
| 50 nano-sec. | 3 Meters (10 ft) |
| 0.1 μ sec. | 6 Meters (20 ft) |
| 0.5 μ sec. | 31 Meters (100 ft) |
| 1 μ sec. | 62 Meters (200 ft) |
| 2 μ sec. | 125 Meters (400 ft) |
| Any with SWF | *Infinite length |

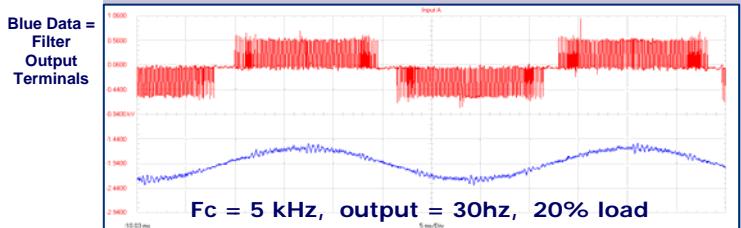

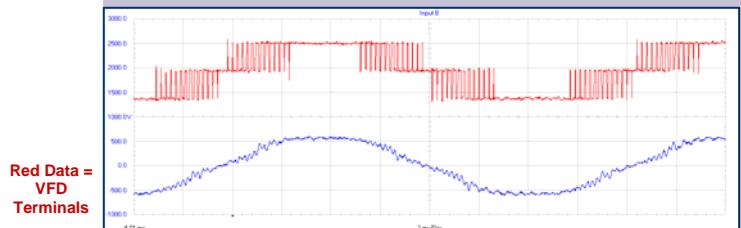

Arteche Sine Wave Filters solve voltage reflection and dv/dt problems

2.0 - 2.5 kHz PWM Frequency

Arteche Type SWF Sine Wave Filters effectively protect motors by filtering both the harsh PWM voltage and reflected voltage, thereby reducing dv/dt to minimal levels and returning the voltage to a sinusoidal waveform.

> 5 kHz PWM Frequency

By providing near sine wave voltage for the motor, the motor windings are protected, the motor operates with lower temperature rise and with lower power losses.

When to Use Type SWF Sine Wave Filters

Applications

SUBMERSIBLE MOTORS

Submersible motor applications are unique because the motor cables are immersed in water (or other medium), and the dielectric constant for water is about eighty times greater than for air. This means the inverter output circuit capacitance is much higher than for conductors in air (typical conduit applications), and therefore voltage reflection will be more pronounced. Submersible motors should always be protected by **Type SWF Sine Wave Filters** regardless of cable length.

CONDUCTORS IN AIR

Depending on motor cable length, when conductors (and conduit/raceway) are in air, the survivability of a motor will depend on cable length and system voltage. When motors are operated from low system voltage (200-240V) and with shorter cable lengths, they can typically be protected by a reactor of about 4-5% impedance. Higher system voltages and longer cable lengths require **Sine Wave Filter** protection when motor cables exceed critical cable length (see chart on page 2), reactors or sine wave filters should be applied (as per the chart below).

Suggested Motor Filter Application Chart

| Motor | Motor Cable Length | | | | |
|--------------------------|--------------------|----------------|----------------|--------------|-----------|
| | 100 ft | 300 ft | 500 ft | 1,000 ft | 15,000 ft |
| Submersible Pumps | SWF | SWF | SWF | SWF | SWF |
| 230 V motors | 4-5% Impedance | 4-5% Impedance | 4-5% Impedance | 5% Impedance | n/a |
| 400 V motors | 4-5% Impedance | 4-5% Impedance | 5% Impedance | SWF | SWF |
| 460 V motors | 4-5% Impedance | 4-5% Impedance | SWF | SWF | SWF |
| 575 V motors | SWF | SWF | SWF | SWF | SWF |
| 690 V motors | SWF | SWF | SWF | SWF | SWF |

Background

VOLTAGE REFLECTION

Voltage reflection is caused when fast rising voltage pulses, such as those produced by PWM inverters, travel on an electrical conductor that is terminated by a high impedance load (motor). The magnitude of the reflected pulse is a function of the characteristic (or surge) impedance of both the cable and motor. The greater the mismatch between motor and cable surge impedance the greater the reflected voltage pulse. The safe distance for the motor cable length is a function of both the impedance mismatch (between motor and cable) and the pulse voltage rise time (IGBT characteristic). See the critical cable length chart on page 2.

NEMA STANDARD MG-1, PART 30 & 31

Arteche **Type SWF Filters** meet the requirements of both Nema standard MG-1, Part 30 (non-inverter duty motors) and Part 31 (inverter duty motors). **Type SWF Sine Wave Filters** protect motors against premature insulation breakdown caused by excessive peak over-voltage and dv/dt. Nema standard MG-1, Part 30 requires 1000V peak or less and the rise time must be 2 micro-seconds or slower. **Type SWF Sine Wave Filters** achieve this for all VFDs and motors rated 690 volts or less.

Nema Std MG-1 limits.

Part 30: $\leq 1000 \text{ V}_{\text{pk}}$ and $\geq 2 \mu\text{sec}$ rise time
Part 31: $\leq 3.1 \times V_{\text{rated}}$ and $\geq 0.1 \mu\text{sec}$ rise time

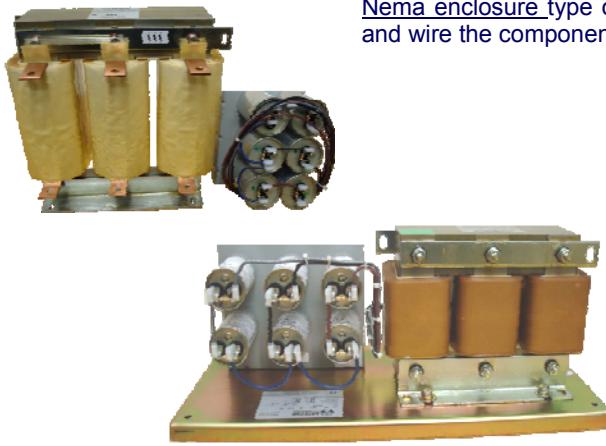

ARTECHE

Your Choice of Filter Configurations

OEM Kits, Panel Assemblies, Nema Enclosed Filters

Total flexibility for integrating a Sine Wave Filter into your drive system

ARTECHE gives you the choice - use one of our fully assembled **Sine Wave Filters** in the Nema enclosure type of your choice, select an open panel version of the filter, or mount and wire the components on your own panel by using one of our economical OEM kits.

1. OEM Component Kit

By using ARTECHE OEM Component Kits, you gain total flexibility to adapt the **Type SWF Sine Wave Filter** to your available panel space. We supply the components, you supply the labor.

The OEM Component Kit contains either one or two inductors (5kHz uses 1, 2.5kHz uses 2) plus all capacitor cells necessary to construct our standard **Sine Wave Filter**.

- Inductor available with optional temperature switch.
- Capacitor wiring harnesses are also available.

Type SWF Product Specifications

Electrical Ratings

Voltage:.....400, 480, 600, 690 VAC
200 - 240 VAC available on request
Phase:.....3-phase
Frequency:.....50/60 Hz
Switching Frequency:.....≥5 kHz; 2.5 kHz
Other frequencies available on request
Per phase inductance:.....+/- 3% tolerance for all three phases
Typical voltage regulation.....7.5% voltage drop at filter full load

Performance

Output Waveform:.....Sine wave
Voltage Distortion:.....Less than 5% THD-v (5Khz version)

Environment

Ambient Temperature:.....50°C
Altitude:.....1000 meters
Motor Distance:.....Any
Ventilation:.....Free connection (No fans required)

Agency Approvals

Inductors:.....UL-508, IEC 76, IEC-289
Capacitors:.....UL-810
Assemblies:.....UL-508A

Type SWF Sine Wave Filters supply motors with sinusoidal wave forms for longer life and smoother operations of VFD driven motors.

Component Construction

Arteche Type SWF Sine Wave Filters are produced with precision reactors and high performance capacitor cells. They are designed for natural convection cooling, so they only require adequate ventilation and can operate in ambient temperatures up to 50 degrees Celsius. They do not require damping resistors or fans, and therefore offer both high efficiency and high reliability.

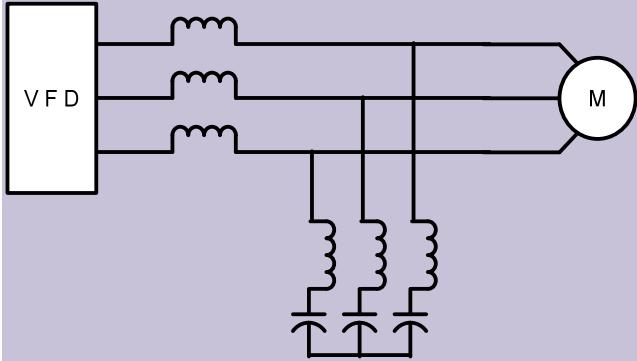

Type SWF Filter reactors are specially constructed for PWM waveforms using PolyGap™ core technology for low power losses as well as balanced inductance. The inductance (mH) of our reactors is within +/- 3% for all three phases, assuring balanced voltage drop.

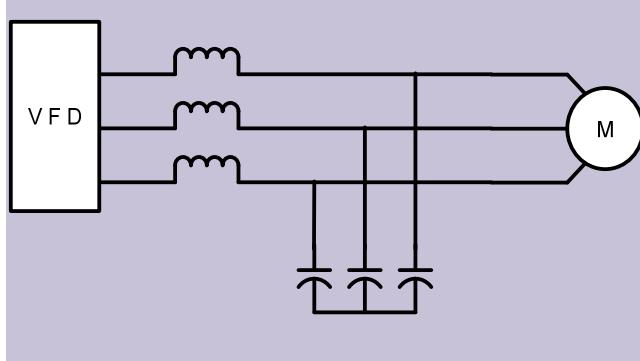

Type SWF Filter capacitors are constructed using metallized polypropylene elements which are encased in metallic canisters and filled with high performance, biodegradable dielectric fluid (free of PCBs). Capacitors used in our filters are self-protecting and self-healing. In the event that the capacitor experiences an insulation breakdown, (possibly caused by excessive voltage or over-current), a UL approved internal pressure-sensitive switch will interrupt the internal electrical connections to prevent the case from rupturing. Our UL approved self-protecting and self-healing features eliminate the need for fuses in the filter capacitor circuit.

Circuit Diagrams

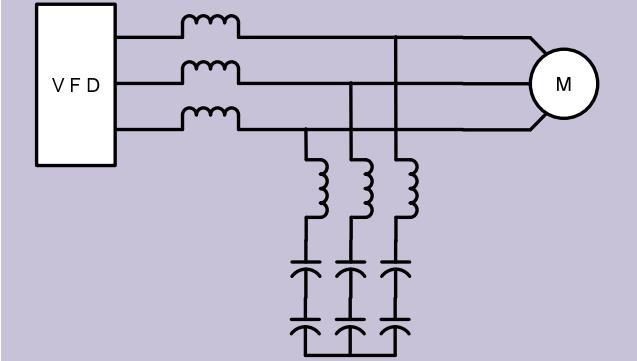

2.5kHz SWF (200V – 480V)

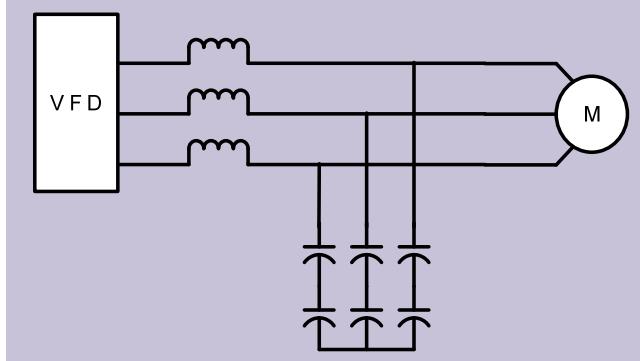

5kHz SWF (200V – 480V)

2.5kHz SWF (600V – 690V)

5kHz SWF (600V – 690V)

Type SWF Sine Wave Filters offer motor protection for long motor lead installations such as mining, submersible pumping, and other applications.

ARTECHE

Selection Tables for 2.5kHz Sine Wave dv/dt Filters (50/60 Hz)

Select **Type SWF Sine Wave Filters** based on three phase motor voltage and FLA ratings. If FLA is not known, then filters may be selected based on motor HP rating. Consult factory for use at fundamental frequencies above 60Hz, other voltage or power ratings, or other PWM carrier frequencies.

Type SWF Sine Wave Filters are available for any voltage, frequency, ampere or HP / kW rating. Consult factory for special ratings. OEM kit, panel mounted, and enclosed versions available by adding * appropriate suffix to the catalog number. See suffixes below chart.

Selection Chart for VFD with Carrier Frequency set to 2-2.5 kHz

***Add appropriate suffix - For OEM Kit, Open Panel or Nema enclosed filters:**

CMP = OEM Kit, **PNL** = (Open Panel), **N1** = (Nema 1), **N3R** = (Nema 3R), **N12** = (Nema 12)

**Contact ARTECHE PQ for solutions to
Harmonic Distortion and Low Power Factor
Low Voltage, Medium Voltage and High Voltage Solutions**

Harmonic Filters

- Low Pass Harmonic Filters (5%THD-i)**
- Tuned Harmonic Filters**
- Active Harmonic Filters**
- Automatic Harmonic Filters**
- 12 & 18 Pulse Rectifier Upgrade Kits**
- Soft Switching Harmonic Filters**

Power Factor Improvement

- Fixed Capacitor Systems**
- De-Tuned Capacitor**
- Active PF Compensation**
- Automatic Capacitors**
- Dynamic VAR Compensation**
- Soft Switching Capacitor Systems**
