**Cutler-Hammer Instantaneous Trip Motor Circuit Protectors
(HMCP) In Combination NEMA Starter, Application-Rated Soft
Starter Controller (SMC) and Variable Frequency Drive Units**

**Cutler-Hammer 150A Frame
Instantaneous Trip Motor Circuit Protector (HMCP).**

Application

Circuit breaker application is valid for the following Bulletin 2100 products:

- Bulletin 2107 Full Voltage Reversing Combination Starters
- Bulletin 2113 Full Voltage Non-Reversing Combination Starters
- Bulletin 2123 Two Speed Combination Starters
- Bulletin 2127 Two Speed Reversing Combination Starters
- Bulletin 2155 Combination Soft Starters
- Bulletin 2163 Variable Frequency AC Combination Drive Units
- Bulletin 2165 Variable Frequency AC Combination Drive with Manual Isolated Drive Bypass
- Bulletin 2173 Reduced Voltage Autotransformer Combination Starters

The information in this publication applies to Cutler-Hammer motor circuit protectors (HMCP) when they are used in NEMA (size 1 through 6) combination starter, soft starter controller, and variable frequency drive units. The particular circuit breaker (trip range) supplied with a unit depends on the horsepower or kilowatt rating and voltage that was specified when the unit was

ordered. Tables 1 - 11 list the various combinations of circuit breakers and unit ratings. When using Tables 1 - 11, be sure to use the line that applies to your equipment.

IMPORTANT: The information in this publication does not apply to inverse time circuit breakers. For combination starter units, soft starter controller units and variable frequency drive units with inverse time circuit breakers, refer to Publication 2100-TD002x-EN-P, *Cutler-Hammer Inverse Time Circuit Breaker in Combination NEMA Starter, Application-rated Soft Starter Controller (SMC), and Variable Frequency Drive Units*.

Circuit Breaker Size and Adjustment

Packaged Control Products has made engineering evaluations for the protective device (circuit breaker) selection, sizing, and setting range based on the protection rules/requirements and motor criteria as stipulated in CEC, NEC, NEMA, UL and CSA Standards, e.g. motor full load currents (FLC), X/R ratios, lock rotor currents, nominal utilization voltages, etc. Should the motor application have criteria that deviates from those stated in the aforementioned standards, higher FLC and/or motor inrush currents (greater than 1300% of the nominal FLC) may be experienced, e.g. special motors, non-off standard NEMA or application-rated motors, Design B energy efficient, Design E motors, IEC N motors, etc.

The circuit breaker is shipped with the instantaneous trip arrow set to the lowest value. The motor full load current determines the magnetic trip setting of the HMCP circuit breaker. Rockwell Automation recommends selecting a trip setting that is approximately ten times the motor nameplate full load current. The trip setting can be adjusted to a position which corresponds to the determined magnetic trip current: positions A through H for 150A and 600A frames, and A through I for 250A and 400A frames. To adjust the trip setting:

- a. Make certain that the circuit breaker operating handle is in the **OFF/O** position.
- b. Depress the adjustment pointer with a small screwdriver, and turn clockwise to the determined setting. Verify that the circuit breaker will not trip during motor starting. If the circuit breaker trips when attempting to start the motor, turn the pointer clockwise to successively higher positions, until the circuit breaker no longer trips when attempting to start the motor. Per the NEC the trip setting of the circuit breaker must never exceed 13 times the motor full-load current. The controller design is based on this requirement. Should Design B or E energy efficient motors (or IEC N motors) be utilized it may be necessary to set the breakers higher than 13 times the motor full-load current, but, should not exceed 17 times (change per 1999 NEC). For these applications consult the factory for controller and breaker sizing.

Refer to the National Electrical Code (NEC) or the Canadian Electrical Code (CEC) for more information.

NOTE: When the devices are energized, motor peak inrush current can randomly exceed the maximum limit set by the code.

Push-To-Trip Mechanism

The push-to-trip mechanism provides a manual means for tripping the circuit breaker. Depress the red button on the circuit breaker cover. When the button is pushed, a plunger rotates the trip bar causing the breaker to trip, thus opening the HMCP contacts.

Horsepower and Kilowatt Ratings

The horsepower ratings for combination starter units, soft starter controller units, and variable frequency AC drive units listed in Tables 1 through 8 were determined from full load currents as specified by NEC/CEC.

Acceptable performance should occur when the motor full load current is within 15% of the value which corresponds to the horsepower or kilowatt ratings and voltages listed in the NEC/CEC. Consult your local Rockwell Automation sales office or Allen-Bradley distributor if the motor full load current is not within these limits.

ATTENTION

ATTENTION: The horsepower and kilowatt ratings and corresponding trip settings in Table 1 -3 and Bulletin 2155F only in Table 4 are only valid when the combination starter units and soft starter controller units are equipped with an Allen-Bradley SMP solid-state overload relay or a Bulletin 592 overload relay (motor running overcurrent protective device) that has correctly sized heater elements.

When correctly selected, this combination of equipment protects against short circuit and ground fault damage, and provides coordinated overcurrent protection in the motor branch circuit for continuous-duty rated motors, as defined in the NEC and CEC.

The circuit breaker tripping may indicate the interruption of a high fault current. To ensure protection against fire and/or shock hazard, examine the current carrying parts of the combination starter units, soft starter controller units, and variable frequency drive units and replace if damaged. (Refer to NEMA Standards Publication Number ICS 2.2, *Maintenance of Motor Controllers After a Fault Condition*, and NEMA Standard Publication Number ICS 2, Parts ICS 2-302).

Table 10 — Combination 2163R PowerFlex 700 Drive Units (380 - 415V, 460V) and 2165R PowerFlex 700 Drive Units with Manual Isolated Drive Bypass (460V, 575V) - Instantaneous Trip Motor Circuit Protector (HMCP)

Continuous Current Rating (Amperes)	Drive Output Rating (Amperes)	Nominal Horsepower Rating (Nominal Kilowatt Rating) (The horsepower and kW ratings shown are nominal. The limiting factor in the application and use of the PowerFlex 700 is the output ampere rating.)			Magnetic Trip Setting				Magnetic Trip Setting					High Interrupting Capacity Suffix Letter "CA"
